Industrial skills development

Challenges and opportunities in developing countries

Shoko YAMADA
Nagoya University
The structure of presentation

Why is the industrial skills development necessary?
• The node to link and achieve various developmental goals
• Skills ⇔ SDGs, poverty reduction, and economic growth

What does it mean to be competent at work?
• Do we really know the exact contents of “skills” to be developed?
• The latest global discussion on the concept of “knowledge”

Why does skills gap occur?
• “Live together but in different worlds” – Why is the coordination among stakeholders so difficult?
• Twin gaps of supplies and demands in the labor market
• Fluidity and multi-dimensionality of targets and contents

Who demands for TVET?
• The skilled workers are necessary but should they be trained at TVET?

Any impact of COVID on skills development?
Skills are the foundation of economic growth and poverty reduction.

- **Formation of knowledge/skills for decent work and sustainable entrepreneurship**
- **Training for middle level technicians**
- **Education for high level expert to lead the economy of the country**

Diagram:
- **Poverty Reduction**
- **Industrial Development**
  - Informal sector
  - Formal sector
Social investment for the growth of developing countries

- Human capital
  - Capacities of individual workers. Its improvement will enhance the workforce’s productivity

- Physical capital
  - Infrastructure (road, railway, etc.)
  - Machineries and equipment
  - Land, facilities

- Financial capital
  - Cash, stock, bond

- Social capital
  - Human relationship which promote the business partnership

Many governments, particularly those aiming to achieve rapid economic growth increase the budget for education. Budget increase does not necessarily guarantee the improvement of productivity or employment.
Countries depending on labor-intensive industries tend to increase the number of employment but with low productivity.

<Macro-economic viewpoint>
To depart from the “competition to the bottom”, highly skilled workforce is key to improve productivity.

<Viewpoint on poverty reduction>
Improved abilities will lead to secure jobs and income growth for the individuals.

Employment and labour productivity growth by region

Human resources are the key.

SDGs and Industrial Skills Development

Effects on the side of developing countries

Industrial skills development

Node of development needs

Global actors
- Overseas Development Cooperation
- Localized production of FDI companies
- Global Value Chain
- CSR
What causes the skills gap?
“Live together but in the different worlds”

Our school has XX major and the graduates will have specialist certificate

School teacher

Our national plan is to be a middle income country by 2030. To achieve it, we need more high skilled workers in ZZ industry.

Government officials

We invest in Country A but cannot find competent people to be local managers.

Employers

We need workers who can work accurately and efficiently.

I want to be an IT engineer

Youths

I will be a fashion designer!

Youths
Twin gaps of supplies and demands of skills in the labor market

Supply side

**Educator/Trainer**
- Skills they teach

**Workers**
- Actual skills they have
- Self-efficacy, motivation

Demand side

**Employer**
- Skills they expect to workers

Supply-Demand Gap (1)
Supply-Demand Gap (2)
Do we know what “employable skills” are?

• **Skills to solve problems** in the context of work
  
  Identify problems → find causes of problems → find solutions → apply techniques to solve problems

• **Problem-solving skills** are the comprehensive whole of vocational skills, cognitive skills (literacy, numeracy and theories) and non-cognitive skills (attitudes and values)

➡ Increasing attention to the noncognitive skills in
Taxonomy of cognition

- **Socio-emotional skills**
  - interpersonal skills
  - team work
  - autonomous activities

- **Meta-cognitive skills**
  - Problem-solving, discovery, creativity
  - Logical and critical thinking
  - Adaptive learning

- **Cognitive skills**
  - Language skills
  - Mathematical skills
  - Information skills
  - Technical skills

- **Noncognitive skills**

Cognitive skills can explain only a minor part of the effects of education on labor market outcomes such as employment or income (Bowles et al. 2001)

Skills assessed as the competencies developed at school

The domain considered as work-related skills conventionally

Problem-solving at work ≠ getting high score in exams

Katsuno 2013 adopted from Bloom
Schooling ≠ Skilling

Does the increased investment in TVET solve the problem of skills mismatch??

• How does the supply-demand gap occur?
  1. The government planned the resource allocation among different education levels mistakenly → created many workers with “Over-education” and “Under-education”
  2. The criteria of evaluating the quality of workforce is often not the education qualification but skills ← there is no established benchmark of assessing skills
  3. There are significant gaps of perception between the employers and the trainers/educators, but demand side data is often unavailable → The skills development plans are made without demand side information
When, where, and what kind of skills do they need to develop?

Learning is a lifelong process

Skills/Knowledge specific to the workplace

Pre-employment
- Higher ed
- Secondary
- Primary
- TVET
- Off-JT (Off-site)
- Off-JT (on-site)
- Adult literacy
- General skills/knowledge

Upskilling after employment
- OJT
- Apprenticeship

Source: author
First thing we need to do is to diagnose the causes and nature of skills gap first

What are the contents of skills which cause the mismatch?

– Abilities to conduct specific tasks → Vocational/operational skills
– Personalities and attitude? → Noncognitive skills
– Basic cognition which enables continuous learning? → Cognitive skills
– Educational certificate → Expansion of the school system

Are there any system-level deficits?

– Asymmetry of information on employment → Matching job opportunities
– The fast pace of change of the employers’ skills needs → Routinized needs assessment and enhanced flexibility and responsiveness of the training system
– Legal and financial framework to promote skills development does not exist or malfunctional → Skills development act, Occupational standard, accreditation, skills development fund, subsidies
– Low quality of training contents and delivery → Improvement of training materials and trainers

<td></td>
</tr>
<tr>
<td>Promotion of employment</td>
<td><strong>Matching recruiters and job searchers</strong></td>
<td>• Establishment of an employment agency</td>
<td>• Open recruitment (reduce closed recruitment)</td>
<td>• Make the info of students and graduates available for recruiters</td>
<td>• Proactive job search</td>
</tr>
</tbody>
</table>

**Direct provision of TVET is only a minor part of the government’s role in skills development**
Who demand for the government-led skills development most?

• The recent neo-liberal conception of skills development demands the government more coordinative role than direct involvement in training provision
  – To mitigate the asymmetry of information between the supply and demand
  – To incentivize the skills development by reducing the financial and system barriers

• Large companies (e.g. factories of the global multinationals) have their own priorities and strategies of workers’ skills development and promotion driven by their own internal labor market

• TVET demands are higher among SMEs and informal sectors which do not have the capacity to internalize their workers’ training

• Linkage between the plans for industrial development and skills development is a key
COVID and the new demands for skills development

• **Vocational training without contact?**
  – Increased inequality of learning opportunities ← aggravation of existing problem
    • Lack of access to school, alternative tools of learning, or learning support
  – Restriction of practice-based training ← New challenge
    • Despite TVET reforms to increase relevance, a large part of the practical training and internship were suspended

• **Changed mode of business operation**
  – Enhanced transfer of goods without human interactions
    ← More reliance on IT and indirect communication skills

• **Problem-solving skills in the era of with-COVID**
  – Performance evaluation will be more outcome-oriented than sharing the process
  – Attentive and accurate work without visible outcomes will not appeal to the supervisor
  – Capacities to verbalize (= express in written or spoken words instead of actions or feeling) the work-related concerns and achievements will become more important
We can diagnose the skills of workers from multiple angles

- Our module provides pictures about the complex relationships among cognitive, non-cognitive (behavioral), and vocational skills
- We can compare the perspectives of different stakeholders and identify the exact nature of gaps
- We can provide evidence-based proposals for improving the skills development plan
1. Identify the exact contents of gaps among multiple stakeholders

- Trainer/Educator (Supply side of skilled workers)
  - Expectations on skills
- Employer (Demand side of skilled workers)
  - Expectations on skills

- Same questionnaire on skills expectation
- Skills assessment of workers
- Questionnaire for worker
- Actual performance of workers
- Workers’ self-estimation of skills
2. Diagnosis of Overall Performance of workers and students

Overall Performance

Vocational skills

Cognitive skills
- Basic mathematics
- Reading comprehension
- Integrated problem-solving

Behavioral (non-cognitive) skills
- Leadership, teamwork, tidiness, obedience, punctuality, etc.

Personality traits
- Extraversion, conscientiousness, emotional stability, openness, agreeableness
3. Identification of factors which influence the performance

What makes their performance different??

- Educational background?
- Years of experience?
- Home background?
- Gender?
- Commuting distance?
- Absenteeism?
